NOTE: This is a 'working draft' sequence. It currently consists of 37 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

Direct Submission

Submitted (19-UTL-2001) Sanger Centre, Hinxton, Cambridgeshire,
CB10 1SA, UK. Email enquiries: humquery@sanger.ac.uk Clone
requests: clonerequest@sanger.ac.uk

On Jul 28, 2000 this sequence version replaced gi:5924017.

During sequence assembly data is comparated as variations
together with a note of the overlapping clone name. Note that the
variation annotation may not be found in the sequence submission
corresponding to the overlapping clone, as we submit sequences with
The following abbreviations are used to associate primary accession
numbers given in the feature table with their source databases:
Em:, EMBL; Sw:, SWISSPROT; Tr:, TREMBL; Wp:, WORNDEP; Information

Human DNA sequence from clone RES-977B1 on chromosome 20 Contains BSTS, STSS, GSSs and three putative CpG islands. Contains the 3' end of the gene for a novel protein tyrosine kinase, a heterogeneous nuclear ribonucleoprotein A3 pseudogene, the gene for three isoforms of a novel protein similar to putative the second of a novel protein final of putative threating protein, the TGTP2 gene for TGF(beta)-induced transcription factor 2 with two isoforms, the MYRL2 gene for myosin regulatory light chain 2 (smooth muscle isoform), the 3' end of the gene KIAA0964 (ortholog frat RSD-95/SAP90-associated protein 4) with two isoforms and a novel gene, complete sequence.
                                                                                                                                                                                                                                                                          99745 AGCTAGAGCTCCAAGGACCCCACGCCTGTGTCTCTGTGACAGAGCTCAAAGGGCCCTGGG 99804
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 99924

This sequence is the entire insert of clone RP5-977B1 The true left end of clone RP3-460/B is at 63245 in this sequence. The true right end of clone RP3-18019 is at 63245 in this sequence. This sequence was finished as follows unless otherwise noted all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest. RP5-977B1 is from the library RPCIS constructed by the group of Pieter de Jong. For further
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              /gene="KIAA0564"

                                                                                                                                                                                                                                                                                                          28-FEB-2002.
                                                      ABK61465;
RESULT 1
ABK61465
```

The invention relates to an isolated polypeptide (NOVX) a mature form of

```
NOVX, a NOVX variant (differing by no more than 15%), the nucleotide encoding NOVX (or its complement, fragment or variant). NOVX is NOV1-14, 254, 155, 164, and 165. The NOVX polypeptide, nucleic acid encoding it and antibody against it, rae useful for treating or preventing (e.g. by gene therapy) a NOVX-associated disorder in humans, e.g. cardiomyopathy, theresolves a NOVX-associated disorder in humans, e.g. cardiomyopathy, and antibody against it, are useful for cell signal processing and metabolic pathway modulation, diabetes or cancers. The NOVX polypeptide are and and polypeptide of and mucleic acids are also useful for determining the presence of predisposition to the diseases. The NOVX nucleic acid and polypeptide are especially useful in therapeutic or prophylactic applications for activity, e.g. cancers (e.g. adenocazcinoma, lymphoma, prostete cancer or uterus cancers), immune response, graft-versus-hort disease, acquired immunodeficiarcy syndrome (AIDS), asthma, tronfor's disease, acquired congenital heart defects, multiple sclerosis, inflammation or Albright bereditary osteodystrophy and many other diseases listed in the specialization. The DNA encoding the protein is useful in gene therapy for treating the conditions. This is also useful in detection assays, or treating the conditions. This is also useful in detection assays, or for developing a powerful assay system for functional analysis of various human disorders, as well as in diagnostic applications. The present cancer or encodes a NOVX protein

The invention relates to a substantially purified human SH2/SH3-domain-containing adapter polypeptide, termed Src-Like Adapter Protein-2 (SLAP-C). The invention is useful for trearing an immune disorder involving hyperactivity of B- or T-1 ymphocytes in a manmal. The invention is useful for scenarior of the interaction of hyperactivity of B- or T-1 ymphocytes in a manmal. The invention is useful for scenarior of the interaction of histappe 2 with callular signalling compounds, for diagnosing, treating or preventing diseases or disorders associated with aberrant or uncontrolled collular signal transduction, for determining those cellular signalling molecules which associate with hSLAP-2 and which provide critical signals for cell activation, and as effectors in methods to affect T-cell activation, and as effectors in methods to affect T-cell activation. The invention is useful in screening assays to identity and activation. The invention is useful in screening assays to identity and cetter candidate bioactive agents that modulate hSLAP-2 bioactivity, for potential use to treat autoimmune diseases which may be caused by hyperactivated B cells, as well as to treat diseases which may be caused to hyperactivated T cells, in addition to other immune system related conditions, diseases, or disorders, T-cell and B-cell neoplasms, of theorative colitis), allergies, particularly those involving and ulcerative colitis, autoimmune diseases such as systemic lupus eryhmm actual respiratory distress syndrome, and chronic obstructive pulmonary disorder, tissue/ organizatory distress syndrome, and cancer. The invention is useful in gene therapy. The present sequence is human SLAP-2 cDNA
                                                                                                      Novel substantially purified human SH2/SH3-domain-containing adapter polypeptide, termed Src-Like Adapter Protein-2, useful for therapeutic intervention in immunological and inflammatory disorders and cancer.
                                                                                                                                                                                                                         Claim 2; Fig 1; 85pp; English.

```
The present sequence encodes the human Src-like inhibitory molecule (SLIM) protein (I). The present invention describes a SLIM protein comprising an N-terminal sequence, an N-terminal SH2 domain, and an N-terminal SH3 domain which can bind to Cbl, or comprising an N-terminal myristylation sequence and an N-terminal SH2 domain which is unable to bind to Cbl. (I) has antiinflammatory, immunosuppressive and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention comprises the amino acid and coding sequences of modulator of antigen receptor signalling (WARS) proteins. The MARS protein is a putative tumour suppressor gene and exhibits structural and sequence similarity to the Sor-like adaptor protein (SLAP). The MARS DNA and protein sequences of the invention are useful for the treatment of myelofd malignancies (e.g. acute myelogenous leukaemia) autoimmune disorders, immunosuppression, myeloproliferative disorders and malignancies related to the de-regulation of tyrosine kinases (e.g. breast cancer). The present cDNA sequence encodes a human MARS protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   181 Arcgrerergaggargaagaergargaaggaggergrergaagrereaggaggagrar

activation, and of ubiquitination of a Cbl target protein, and in gene activation, and of ubiquitination of a Cbl target protein, and in gene thereby. (I) is useful for screening a bloactive agent capable of binding to SIIM. (I) is also useful for screening a bloactive agent capable of modulating SIIM binding. (I) or its fragments is useful in the study or in the treatment of conditions which involves this function or dysregulation of SIIM protein activity, i.e. to diagnose, treat or prevent SIIM associated disorders. (I) or the polynucleotide encoding it (II) is useful for modulating leukocyte and/or platelet activation, for modulating antigen receptor-induced signalling and activation in leukocyte and/or mast cells. (I) or leukocyte and/or platelets and for modulating antigen receptor-induced signalling antigen receptor-induced signalling antigen for modulating the basal activity of lymphocytes. (I) or is also useful for modulating the basal activity of lymphocytes. (I) or is also useful in the treatment of immunodeficiency disorders, such as acquired immunodeficiency syndrome (AIDS), for the prevention and treatment of acute inflammatory disorders, choic inflammatory disorders, autoimmune disorder and transplant rejection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            998 GGCAAGGATATACCCCTACCTGTGACTGTGCAGAGACACCACTCAACTGGAAAGAGCTG 1057

The present invention relates to novel human ORFX polypeptides and their coding sequences (ABP63631-ABP64681 and ABQ99194-ABQ99267). The sequences were discovered in human atherogenic cells, in particular in platelets and human umbilical vein endothelial cells (HVVBC) and are expressed in many other tissues as well. Atherogenic cells are cells which have the potential to develop atheroscierotic plaques. The ORFX polypeptides and nucleic acids are useful for treating or preventing a pathological condition associated with an ORFX-associated disorder, e.g. cancer, cardiovascular disease, allergy, autoimmune disease, wound healing, blood cardiovascular disease, inflammatory disorders. Note: The sequence data for this patent did not form at the printed specification, but was obtained in electronic format directly from the USPTO web site at
New polypeptide designated ORFX are present in human atherogenic cells and are useful to prevent and treat ORFX-associated disorders including cancer, allergy, wound healing or autoimmune, cardiovascular or inflammatory disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Antinflammatory; gene therapy; human; ORFX; atherogenic; platelet; human unbilical veh endothellal cell; HUVEC; atheroscierotic plaque; cancer; cardiovascular disease; allergy; autoimmune disease; wound healing; blood coagulation disorder; inflammatory disorder; ds.

AAC74446 to AAC77606 encode the proteins given in AAB40237 to AAB43397,
which represent the human ORFX open reading frames 1 to 3161. The ORFX
sequences have activities such as: cytostatic; hepatotropic; vulnerary;
antipsoriatic; antiparkinsonian; nootropic; hepatotropic; vulnerary;
antipsoriatic; antiparkinsonian; nootropic; neuroprotective; osteopathic;
cardiant; thrombolytic; coaquiant; vasotropic; antibabetic; hypotensive;
cardiant; thrombolytic; coaquiant; vasotropic; antibabetic; hypotensive;
cardiant; thrombolytic; coaquiant; vasotropic; antibabetic; hypotensive;
cardiant; thrombolytic; coaquiant; vasotropic; antibabetic; hypotensive;
cardiant; thrombolytic; cardiant; antibacterial;
antiviral; antifungal; antirheumatic; antithyroid; and antianaemic. The
sequences can be used for determining the presence of or predisposition
to, or preventing or treating pathological conditions associated with an
tot or preventing or treating pathological conditions associated with an
tot or preventing or treating pathological conditions associated with an
tot or preventing or treating pathological conditions associated with an
tot or preventing or treating pathological conditions associated with an
tot or preventing or treating pathological conditions associated with an
total cardiant or treating pathological conditions associated with an
total cardiant or treating pathological conditions associated with an
total cardiant or treating pathological cardiants and antidocation and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   637
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            240
                                                                                                                                   The invention comprises the amino acid and coding sequences of modulator of antigen receptor signalling (MARS) proteins. The MARS protein is a putative tumour suppressor gene and exhibite structural and sequence similarity to the Sor-like adaptor protein (SLAP). The MARS DNA and protein sequences of the invention are useful for the treatment of myeloid malignancies (e.g. acute myelogenous leukaemia) autoimmune disorders, immunosuppression, myeloproliferative disorders and malignancies related to the de-regulation of tyrosine kinases (e.g. breast cancer). The present cDNA sequence encodes a mouse MARS protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     697

                                                                                                               8
                                                                                                                                                                                                                                                                                          g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to novel human coding sequences (ABG99268-ABG99608) and proteins (ABF64682-ABF65022). The sequences are useful in the research methods. The polynucleorides may be used in the field of molecular biology as hybridisation probes, primers for PCR, for chromosome and gene mapping, for the recombinant production of protein, or in generation of anti-sense DNA or RNA. The polynucleotides are useful in diagnostics as expressed sequence tags (BST8) for identifying expressed genes or for physical mapping of the human genome. The proteins may be used as molecular weight markers, or as nutritional sources or supplements. The proteins may be used to maintain and expand cell population in a totipotential or pluripotential state useful for re-engineering damaged or diseased tissues, transplantation, manufacture of bio-pharmaceuticals or the development of bio-sensors. The polynucleotides and proteins are useful for preventing, treating or manufacture of bio-pharmaceuticals or the development of bio-sensors. The polynucleotides and proteins are useful for preventing, treating or manufacture of bio-pharmaceuticals or the development of bio-sensors. The biological activity, e.g. haematopolatic disorders, central/peripheral nervous system diseases, mechanical and traumatic disorders, non-healing wounds, immune deficiencies and disorders, or cancer. The polynucleotide sequences of the invention were assembled from ESTS isolated mainly by sequencing by hybridisation, and in some cases, sequences obtained from one or more public databases. Note: The sequence of the printed specification, but was obtained in electronic format directly from WIPO at the printed specification, or sequences of the printed specification, or sequences of the printed specification, or sequences of the printed formatic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ó

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used

in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to tradt disease states involving (III). (II) is useful for generating antibodies against it, detecting or quantitating apripated in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. AAAS9454 represent novel human diagnostic coding sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print

The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain recardion (PGR) primers, and for thromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal cutivity of (II) at useful in gene therapy techniques to restore normal cutivity of (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders of polypeptide and polymucleotide sequences have applications in polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and and on the printed sequences and to produce other types of data and products dependent on DNA and amino acid sequences. AAS64197-AAS9464 represent novel human diagnostic coding sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WND at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1042 GACCATGGAAGCAGAGGAAGCAAAGGCAACAGCCGTGGCCCTGGGCAGTTTCCCGGCAGG 1101

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to novel human ORFX polypeptides and their coding sequences (ABPG3631-ABPG4681 and ABQ98194-ARQ99267). The sequences were discovered in human atherogenic cells, in particular in platelets and human unbilical vein endothelial cells (HUVEC) and are expressed in many other tissues as well. Atherogenic cells are cells which have the potential to develop atherosclerotic plaques. The ORFX polypeptides and nucleic acids are useful for treating or preventing a pathological condition associated with an ORFX-associated disorder, e.g. cancer, cardiovascular disease, allergy, autolimmume disease, wound healing, blood coagulation disorders or inflammatory disorders. Note: The sequence data obtained in electronic format directly from the USPTO web site at sequence. Language sequence. Attal?poc1D=20020082206
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New polypeptide designated ORFX are present in human atherogenic cells and are useful to prevent and treat ORFX-associated disorders including cancer, allergy, wound healing or autoimmune, cardiovascular or

The present invention relates to novel human ORFX polypeptides and their coding sequences (ABF63611-ABF64681 and AB696194-AB099267). The sequences were discovered in human atherogenic cells, in particular in platelets and human umbilical vein endothelial cells (HVDEC) and are expressed in many other tissues as well. Atherogenic cells are cells which have the potential to develop atherogenical plaques. The ORFX polypeptides and nucleic acids are useful for treating or preventing a pathological

The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PRR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tagg for identifying expressed carbivity of (II) is useful in gene therapy techniques to restore normal control of (II) is useful in gene therapy techniques to restore normal control of (II) is useful in gene therapy techniques to restore normal control of (II) or to traat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical inaging of supplement. (II) and (II) are useful for treating disorders involving abbrrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and anino acid sequences. AASG4197-AASG464 represent novel human diagnostic coding sequences. AASG4197-AASG464 represent novel human diagnostic coding sequences. AASG4197-AASG464 represent did not appear in the printed specification, but was obtained in electronic format directly from WhO at the five the sequences.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (FOR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed continuous. (I) is useful in gene therapy techniques to restore normal ectivity of (II) or to traat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful for treating disorders of sites expressing (II). (I) and (II) are useful for treating disorders of sites expressing (II). (I) and (II) are useful for treating disorders of polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations in diagnostics for genetating desorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and and to produce other types of data and products dependent on DNA and amino acid sequences. AAS64197-AAS94564 represent novel human diagnostic coding sequences. AAS64197-AAS94564 represent novel human diagnostic patent did not appear in the printed specification, but was obtained in the windown of the invention of the confidences.

Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human cervical epithelial cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          270 GAGCTGGCGGATGACATCTGCTGCCTACTCAAGGAGCCCTGTGTCCTGCAGAGGGCTGGC 329
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    130 CCGCTCCCTGGCAAGGATATACCCCTACCTGTGACTGTGCAGAGAGACACACCACTCAACTGG 389
                                                                                                                                                                                     The present invention relates to human single exon nucleic acid probes (SENP). The present sequence is one such probe. The SENPs are derived from human Helia cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably cervical cancer. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at

Homo sapiens EST sequence. This sequence was generated as part of
homo sapiens EST sequence. This sequence was generated as part of
annotate genes in the human genome. Incomplete or unconfirmed genes
are experimentally analysed using a variety of cDNA library
resources. This sequence was obtained from a PCR product generated
from a pool of up to 100,000 cDNA clones derived from
pool YT lib. yEPD cDNA library. Further information can be found at

Homo sapients EST sequence. This sequence was generated as part of
The Wellcome Trust Sanger Institute program to identify and
annotate genes in the human genome. Incomplete or unconfirmed genes
are experimentally analysed using a variety of cDNA library
resources. This sequence was obtained from a PCR product generated
from a pool of up to 100,000 cDNA clones derived from
pool AK_lib v SPD cDNA library. Further information can be found at
